Form groups

The **.form-group** class is the easiest way to add some structure to forms. It provides a flexible class that encourages proper grouping of labels, controls, optional help text, and form validation messaging. By default it only applies margin-bottom, but it picks up additional styles in **.form-inline** as needed. Use it with `<fieldset>`,

s, or nearly any other element.

.form-group forms 가 가 .
.form-group labels, controls, optional help text() form flexible .
.form-group margin-bottom , **.form-inline**
 가 .
`<fieldset>`, `<div>` **.form-group** .

```

<form>
  <div class="form-group">
    <label for="formGroupExampleInput">Example label</label>
    <input type="text" class="form-control" id="formGroupExampleInput"
placeholder="Example input placeholder">
  </div>
  <div class="form-group">
    <label for="formGroupExampleInput2">Another label</label>
    <input type="text" class="form-control"
id="formGroupExampleInput2" placeholder="Another input placeholder">
  </div>
</form>

```

Inline forms

Use the `.form-inline` class to display a series of labels, form controls, and buttons on a single horizontal row.

Form controls within inline forms vary slightly from their default states.

`.form-inline`, labels, form controls, buttons
