git add *(asterisk) VS git add .(period)

add * means add all files in the current directory, except for files whose name begin with a dot. This is your shell functionality and Git only ever receives a list of files.

```
add *                               가
.                                   Git
.
```

add . has no special meaning in your shell, and thus Git adds the entire directory recursively, which is almost the same, but including files whose names begin with a dot.

```
add .                               가      , Git      가      .
(git add * )                       .\|
```

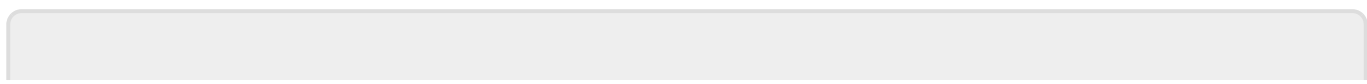

[git] .gitignore

[\[git\] .gitignore](#)

Ref Lnk

[git add *\(asterisk\) VS git add .\(period\)](#)

, [git](#), [add](#), [\(asterisk\)](#), [git](#), [add](#), [\(period\)](#)
